List of rear disc brake conversion: all experimental and will require modification and possibly more R&D

- EP82/91 rear rotors, brackets, calipers, and parking brake cables - Easiest to do, but hard to find parts in the US. Other option is to find the whole rear beam and swap that in.
- VW rear rotors with ford focus rear calipers/custom brackets. Unknown year and model
- 1988 MR2 Supercharged rear rotors/calipers/custom brackets/Corolla FX rear brake cables - Need to turn down stock paseo drum to retain the bearing and hub assembly. Custom brackets are out there but extremely hard to find.
- Integra (I'd assume DC2) rear rotors, EP82/91 Calipers and cables - would still need to turn down the drum to retain bearing assembly
- Scion XB gen2 calipers, ebrake cables - custom bracket required

Front brakes (pseudo BBK) conversion

- 2015 Toyota Yaris front rotors, 95 Corolla calipers
    - **MINIMUM WHEEL SIZE INCREASED TO 15**
- 95 Mazda MX3 front rotors, 95 Corolla calipers - hub needs to be radiused slightly
    - **MINIMUM WHEEL SIZE INCREASED TO 15**
- 2006 Mini Cooper S front rotors and Mazda FC RX7 Turbo II front calipers + custom bracket and 2 washers (FC calipers are 4 pot, but expensive to find and rebuild)
    - **MINIMUM WHEEL SIZE INCREASED TO 15**
- Piecemeal Willwood Setup - requires measurements but figure out rotor size, the hat, fasteners, safety wire, calipers, centering ring for hat, and custom mounting bracket - best performance but also most expensive
- Paseo brakes (if you have a terc)
